Solution 11.16.3.4

Aditya Vikram Singh*

Question 4 A card is selected from a pack of 52 cards

(a) How many points are there in the sample space?
(b) Calculate the probability that the cards is an ace of spades.
(c) Calculate the probability that the card is (i) an ace (ii)black card.

Solution: S is a sample space of given cards ,
Let the random variables(r.v) X,Y and Z denote colour,type and value of the card choosen, where X,Y and Z are uniformly distributed r.v's.
X,Y and Z are independent random variables.

TABLE 3
Random Variable and probability Table

Random variable	value of R.V	Probability
X	1,2	26/52
Y	1,2,3,4	13/52
Z	$1 \leq Z \leq 13$	1/13

(a) The number of sample space points is 52
(b)

$$\Pr(Y=1, Z=1) = \Pr(Y=1)\Pr(Z=1) \quad (1)$$

$$= \left(\frac{1}{4}\right)\left(\frac{1}{13}\right) \quad (2)$$

$$= \frac{1}{52} \quad (3)$$

(c) The probability when the card choosen is ,
(i) an ace $(Z=1)$

$$\Pr(Z=1) = \frac{1}{13}. \quad (4)$$

(ii) black card $(X=1)$

$$\Pr(X=1) = \frac{1}{2}. \quad (5)$$
